                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents insulin-like polypeptide (pro-ILP)
chain A peptide. The ILP protein is expressed in the colon and uterus,
and is a member of the insulin/IGF family. The immature pro-ILP
comprises a 135 amino acid sequence, which is processed into the mature
form which comprises an A chain and a B chain linked by disulfide bonds.
The Creptide of pro-ILP satists as a separate peptide after processing
of pro-ILP. The ILP protein is useful in treatment of disorders related
to neurophysiological function affecting fluid homeostasis, electrolyte
homeostasis, cardiovascular function, blood pressure, somatic or cardiac
ionotropic activity, cardiac chronitropic activity and collagen
conoctasis, condition of the uterus, colon or other ILP-expressing cell
pathodic condition of the uterus, colon or other ILP-expressing cell
or tissue and for diagnosis and screening of modulators and therapeutics.
In the present sequence does not appear in the specification; it was

associated with the polypeptide, such as reproductive disorders associated with the placente and uterus, gastrointestinal diseases, and placental and colon pathology. Antagonists against the polypeptide may also be used to treat diseases such as preclampsia, premature labour, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             molecules taken from its gene can be introduced into a cultured cell using an expression vector. The cell will express an insulin homologue polypeptide encoded by the polynucleotide. The polypeptides can also be expressed by introducing the polynucleotides into the germline of a confuman animal. The polypeptides can be used to identify and isolate receptors for zins3. Antibodies and antagonists of the polypeptides can be used for treating disease associated with extracellular matrix and be used for treating also be used in the diagnosis of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present sequence represents an insulin-like polypeptide (pro-ILP). The protein is expressed in the colon and uterus, and is a member of the insulin/IGF family. The immature pro-ILP comprises a 135 amino acid sequence, which is processed into the mature form which comprises an A chain and a B chain linked by disulfide bonds. The C-peptide of Pro-ILP exists as a separate peptide after processing of pro-ILP. The neurophysiological function affecting fluid homeostasis, electrolyte homeostasis, cardiovascular function, blood pressure, somatic or cardiac inonctropic activity, cardiac chrontcopic activity and collagen deposition. The methods can be used for diagnosing a physiologic or pathologic condition of the uterus, colon or other ILP-expressing cell or tissue and for diagnosis and screening of modulators and therapeutics.

Isolated PRO211, PRO228, PRO538, PRO172 or PRO182 polypeptides

Cor their agonists (preferably anti-PRO agonist antibody or a small

molecule minicking the biological activity of PRO polypeptide) are

useful in vitro or in vivo for inhibiting the growth of a tumour cell.

Compositions comprising the PRO polypeptides are useful for

inhibiting neoplastic cell growth and for treating cancer including

breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder,

central nervous system cancer, melanoma and leukaemia in a mammal.

Central nervous system cancer, melanoma and leukaemia in a mammal.

Central nervous polypeptides are also useful for treating other disorders

cuch PRO polypeptides are also useful for treating other glandular,

macrophagal, epithelial, strongtal, hypothalamic and other glandular,

chiflammatory, angiogenic and immunologic disorders as well as being

useful for identifying agonists to PRO polypeptides by contacting the

custivity mediated by the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ashkenazi AJ, Goddard A, Gurney AL, Klein RD, Napier MA, Wood WI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PRO211, PRO228, PRO538, PRO172 and PRO182 polypeptides useful for treating tumors including cancers of the breast and lung, leukeamia and for identifying compounds capable of inhibiting

nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB24435 represent nucleotide and protein sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is that of zins3, a novel member of the insulin/relaxin family. The zins3 gene maps to human chromosome 1p31, a region that is correlated to a heritable form of non-insulin dependent diabetes mellitus (NIDDM). zins3 mRNA is not expressed
                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                             ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Richerence number: 847489
A. Descripțion: Expression and developmental regulation of EHK-1, a neuronal ELK-like rec
A. Reference number: 847489
A. Accession: 847489
A. Accession: 847489
A. Accession: 847489
A. Accession: 847489
A. Residus: preliminary
A. Molecule type: mrnA
A. Status: preliminary
A. Residus: 1-898 c/742>
A. Cispecfamily: protein-tyrosine kinase, receptor type eph; fibronectin type III repeat h
Cisuperfamily: protein kinase homology «KIN»
F; 568-834/Domain: protein kinase homology «KIN»
F; 568-834/Region: protein kinase ATP-binding motif

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        "Identification of INSL6, a new member of the insulin family that is expressed in the testis of the human and Rat.";
Biol. Reprod. 62.1593-1599(2000).
-!- FUNCTION: MAY HAVE A ROLE IN SPERM DEVELOPMENT AND FERTILIZATION.
-!- SUBCELLULAR LOCATION: Secreted (By similarity).
-!- TISSUE SPECIFICITY: TESTIS-SPECIFIC.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

"Identification and functional characterization of a new gene encoding the mouse terminal complement inhibitor CD59.";

J. Immunol. 165:2528-2534(2000).

-I. FUNCTION: POTENT INHIBITOR OF THE COMPLEMENT MEMBRANE ATTACK COMPLEX (MAC) ACTION. ACTS BY BINDING TO THE CB AND/OR C9 COMPLEX (MAC) ACTION. ACTS BY SINDING THE CB AND/OR C9 INCORPORATION OF THE ASSEMBLING MAC, THEREBY PREVENTING INCORPORATION OF THE OSMOLYTIC PORE (BY SIMILARITY).

-I. SUBJECTICITY: SPECIFICALLY IN TESTIS.

-I. SIMILARITY: CONTAINS: UUPAR/LYG DOMAIN.

                                                                                                                                                                                                                                                                           tyrosine phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- ALTERNATIVE PRODUCTS: 6 ISOFORMS; 1 (SHOWN HERE), 2, 3, 4, 5 AND 6; ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- TISSUE SPECIFICITY: ALMOST EXCLUSIVELY EXPRESSED IN THE NERVOUS SYSTEM. PREDOMINANTLY EXPRESSED IN NEURONS.
-!- SIMILARITY: CONTAINS 1 SAM DOMAIN.
-!- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
-!- SIMILARITY: BELONGS TO THE TYR FAMILY OF PROTEIN KINASES. EPHRIN
                                                                                                               Lassmann H., Steck A.J.;
Expression and developmental regulation of Ehk-1, a neuronal
Elk-like receptor tyrosine kinase in brain.";
Neuroscience 63:163-178(1994).
-!- FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY. BINDS TO
EPHRIN-A1, -A2, -A3, -A4 AND -A5.
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                  MEDLINE-95206467; PubMed-7898646;

The invention relates to an isolated insulin homologue zinst having chomology to the relaxin family. The zinst gene, located on chromosome composition and a chain comprising amino acid protein, where the Linst polypeptide comprises a B chain and A chain comprising amino acid residues 26.52 and comprises a B chain and A chain comprising amino acid residues 26.52 and comprises a B chain and A chain comprising amino acid residues 26.52 and comprises are useful; in applications for enhancing fertilisation during proteins are useful in applications for enhancing fertilisation during casisted reproduction in humans and animals and in therapies for treating reproductive disorders. Zinst protein is useful in treating reproductive, comprise to its activity. Zinst protein is useful in treating reproductive, collines which respond to the zinst-stimulated pathway and to identify inhibitors of its activity. Zinst polypeptides and modulators of the cinhibitors of its activity. Zinst polypeptides and modulators of the collines which respond to the zinst-stimulated pathway and to identify inhibitors of its activity. Zinst polypeptides and modulation, outation, collective collines are also mother reproductive functions including pathological conditions in ovary. Detection of zinst polypeptides in the serum or tissue biopsy of a patient is useful for diagnosing ovarian cancer. The molecules are also useful for treating dysfunction associated with control, treating importance or other male reproductive dysfunction, collutes and also useful for treating dysfunction, development and/or maturation of ovarian cells, myocytes, endothelial cells, osteoblasts in collution pirth, for promoting growth, differentiation, development and/or maturation of ovarian cells, myocytes, endothelial cells, reproductive directions and fertilisation. The polypeptide is also useful as a modulator of blood pressure, muscle tension and osmotic

AAR AAR95999-R96006 represent the asymmetry sequences of target binding assemblies (TBA) of the invention. The TBA is recognised by the target binding region (TBR) of a probe of the invention. The Probe of the tortion contains a TBR, a booster binding region (BBR), and an contion a trachment (OSA). The TBA contains at least one optional support or attachment (OSA). The TBA contains at least one contains a support or attachment (NSA), and optionally a linker sequence, an asymmetry sequence, an unclear localisation signal sequence, and an OSA. The assembly sequence and asymmetry sequences are responsible for the folding and association of the NARs. The NARs are reported from NF kappa-B, FBL, TATA, human papillomarius (HPV) ETR and Tat binding units. The LINKer sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR correct from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localishing a specific target nucleic acid of specificity. The method is highly sensitive, and has a high degree of specificity. The method can be used for detecting specific nucleic of specificity. The method is highly sensitive, and has a high degree of specificity. The method can be used for detecting specific nucleic of other nucleic acid containing systems, including bacteria and viruses.
                                                                                                                                                                                                                                                                                                                Target binding assembly; nucleic acid recognition unit; NF-kappa-B; SP1; TATA; human papillomavirus; HPV; HPV E2; human immunodeficiency virus; HIV LTR; Tat binding unit; probe; assembly sequence; asymmetry sequence; nuclear localisation signal sequence; human cell; HPV LTR; HIV; bacteria;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Probe nucleic acids, target binding assemblies, etc - for detection and localisation of specific nucleic acid sequences, esp. HIV and

chain B peptide. The ILP protein is expressed in the colon and uterus,

and is a member of the insulin/IGF family. The immature pro-ILP

comprises a 135 amino acid sequence, which is processed into the mature

form which comprises an A chain and a B chain linked by disulfide bonds.

The C-peptide of pro-ILP exists as a separate peptide after processing

of pro-ILP. The ILP protein is useful in treatment of disorders related

to neurophysiological function affecting fluid homeostasis, electrolyte

concurrence are acidate characteristic activity and collagen

conforming the methods can be used for diagnosing a physiologic or

pathologic condition of the uterus, colon or other ILP-expressing cell

or tissue and for diagnosis and screening of modulators and therapeutics.

conce: the present sequence does not appear in the specification; it was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

Identifying mutations in human chromosome 1p31, preferably a zins3 gene mutation, comprises using an insulin/relaxin family member (designated zins3), useful for diagnosing non-insulin dependent diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a peptide from the B chain of human zins3 (see AAY95770). The peptide was used to immunize guinea Pigs, rabbits and chickens to generate antibodies for zins3, which were used in assays to determine the tissue distribution and cell expression of zins3. Zins3 is a novel member of the insulin/relaxin family whose gene maps to a region of human chromosome ip associated with non-insulin dependent diabetes mellitus (NIDDM). Zins3 polynuclectides and polypeptides can be used to diagnose disorders associated with abnormal expression of zins3 and to identify polymorphisms that result from mutations in the zins3 gene. The invention provides methods for identifying abnormalities in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               expression that are a factor in causing, or predisposing, a person to some defect in glucose metabolism, such as NIDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Insulin homologue; identification; isolation; Zins3 receptor; treatment; disease; pre-elampsia; premature labour; Human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The Zins3 protein is an insulin homologue protein. Polynucleotide molecules taken from its gene can be introduced into a cultured cell using an expression vector. The cell will express an insulin homologue polypeptide encoded by the polynucleotide. The polypeptides can also be expressed by introducing the polynucleotides into the germline of a nonhuman animal. The polypeptides can be used to identify and isolate receptors for zins3. Antibodies and antagonists of the polypeptides can be used for treating disease associated with extracellular matrix and vessels. The antibodies may also be used in the diagnosis of diseases associated with the polypeptide, such as reproductive diseases associated with the placenta and uterus, gastrointestinal diseases, and placental and colon pathology. Antagonists against the polypeptide may also be used to treat diseases such as preclampsia, premature labour, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAY01961
```

```
The present sequence represents an insulin-like polypeptide (pro-ILP). The protein is expressed in the colon and uterus, and is a member of the insulin/IGF family. The immature pro-ILP comprises a 135 amino acid sequence, which is processed into the mature form which comprises an A chain and a B chain linked by disulfide bonds. The C-peptide of pro-ILP exists as a separate peptide after processing of pro-ILP. The ILP protein is useful in treatment of disorders related to neurophysiological function affecting fluid homeostasis, electrolyte homeostasis, cardiovascular function, blood pressure, somatic or cardiac hontropic activity, cardiac chronotropic activity and collagen deposition. The methods can be used for diagnosing a physiologic or pathologic condition of the uterus, colon or other ILP-expressing cell or tissue and for diagnosis and screening of modulators and therapeutics.

Isolated PRO211, PRO228, PRO538, PRO172 or PRO182 polypeptides

or their agonists (preferably anti-PRO agonist antibody or a small
molecule minicking the bloiogical activity of PRO polypeptide) are
useful in vitro or in vivo for inhibiting the growth of a tumour cell.
Compositions comprising the PRO polypeptides are useful for
inhibiting neoplastic cell growth and for treating cancer including
breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder,
central nervous system cancer, melanoma and leukaemia in a mammal.
The PRO polypeptides are also useful for treating other disorders
such as neuronal, glial, astrooytal, hypothalamic and other glandular,
inflammatory, angiogenic and immunologic disorders and
inflammatory, angiogenic and immunologic disorders as well as being
useful for identifying agonists to PRO polypeptides by contacting the
colypeptide with a candidate molecule and monitoring biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ashkenazi AJ, Goddard A, Gurney AL, Klein RD, Napier MA, Wood WI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PRO211, PRO228, PRO538, PRO172 and PRO182 polypeptides useful for treating tumors including cancers of the breast and lung, leukeamia and for identifying compounds capable of inhibiting growth of neoplastic cells
                                                                   /note= "cAMP- and cGMP-dependent protein kinase 113\dots117

useful for preventions, distributed actus actus and control of propertions useful for prevention, disponsing and treating disponsing a cardiovascular, endothelial or angiogeneis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and disponsis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB24435 represent nucleotide and protein sequences used in the exemplification of the present invention.

members of the insulin family, cleavage at the C-terminus of the B-chain and at the N-terminus of the A-chain, resulting in removal of the C-peptide. Cysteine residues at positions 29 and 41 (B-chain) and 121 and 135 (A-chain) are capable of associating through cysteine bridges and forming disulfide-bonded molecules.

The zins3 gene maps to human chromosome insulin/relaxin family. The zins3 gene maps to human chromosome to pal, a region that is correlated to a heritable form of non-insulin dependent diabetes mellitus (NIDDM). zins3 mRNA is not expressed in detectable announts in healthy tissue, indicating that the zins3 colynucleotide is a candidate marker for a disease state and/or a specialized cell type. zins3 polynucleotides and polypeptides can be used to diagnose disorders associated with abnormal expression of the zins3 protein, and to identify polymorphisms that result from mutations in the zins3 gene. In particular, the invention provides methods for identifying abnormalities in expression that in glucose metabolism, such as NIDDM. Processing of the mature in glucose metabolism, such as NIDDM. Processing of the mature zins3 protein involves cleavage at the C-terminus of the signal peptide and, based on predicted structural homology with other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying mutations in human chromosome 1p31, preferably a zins3 gene mutation, comprises using an insulin/relaxin family member (designated zins3), useful for diagnosing non-insulin dependent diabetes

These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of novel
             Composition for inhibiting neoplastic cell growth and treating cancers of ovary, uterus, prostate, lung and bladder, comprises PRO211, PRO228, PRO538, PRO172 or PRO182 polypeptide or their agonist

                                                                                                                                                                                                                                                                                                                                                                                      of T-1ymphocytes, the release of a cytokine from peripheral blood monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes, or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polypuclectides encoding
                                                                                                                                              AAU12172-AAU12446 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bloactive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumnours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumnour necrosis factor-alpha (TNF-alpha) from human blood the proliferation or differentiation of chondrocytes, the proliferation or gene expression in pericyte cells, the release of proteoglycans from cartilage, the proliferation of inner ear utricular supporting cells or
        Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammallan tumours e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy.

The present sequence is that of PRO182 (UNQ156), a novel human continuous protein encoded by CDNA (see AAF30052) isolated immunomodulator protein encoded by CDNA (see AAF30052) isolated from a uterine CDNA library. The invention provides Polynucleotides (see AAF30050-62) encoding novel human PRO proteins (see AAB20108-20) including PRO182. Claimed composition of inflammatory cells into a tissue of a mammal, stimulating or enhancing an immune response in a mammal, or increasing the proliferation of T-lymphocytes on mammal in response to an antigon. Claimed compositions of T-lymphocytes in a mammal in response to an antigon. Claimed compositions of T-lymphocytes on agonist antibody or an antagonist have the opposite effect. A claimed method for treating an immune related disorder, involves administering the PRO polypeptide, an agonist antibody or an antagonist antibody. The disorder is selected from systemic lupus erythematosus, rheumatoid arthritis, content antibody or an antagonist antibody. The disorder is selected from systemic lupus erythematosus, rheumatoid arthritis, synemic acternosis, idiopathic inflammatory myopathy, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune harmolytic syndromic autoimmune thrombooytopaenia, thyroiditis, diabetes mellitus, inflammatory bowel disease (lampeliated diseases (such as autoimmune mediated continuomatous hepatitis, sclerosing cholangitis, billiary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease (lampel and cranplantation associated diseases (such as such as sethma, allergic chiming a control of seases (such as asthma, allergic chiming a compound capable of inhibiting the expression of the PRO polypeptide, vectors, host cells and compound capable of inhibiting the expression or the level of expression of the process.
                                                                                                                                                                                                                                                                                       Gurney AL;

The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins compounds which inhibit the expression of a PRO gene. The invention additionally encompasses methods of identifying modulators of PRO expression or activity; diagnosing a cardiovascular, endothelial or additional procession in a PRO gene, or the expression level of a PRO gene within a protein a protein a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular issue; treating a cardiovascular, endothelial or angiogenic clisorder via the administration of a PRO protein, PRO nucleic acid, or PRO agonist or antagonist; a retroviral gene therapy vector comprising a
                                                                                                                                                                      Human; angiogenesis-associated protein; PRO; endothelial cell growth; cardidovascular disorder; endothelial disorder; angiogenic disorder; atheroscolerosis; osteoporosis; hypertension; myocardial infarction; diabetic retinopathy; rheumatoid arthritis; crown sidisease; psoriasis; endometriosis; ulcer; wound healing; cancer; Alzheimer's disease; Huntington's disease; stroke; drug screening; gene therapy; transgenic animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid for producing a PRO polypeptide, analyzing genetic disorders and treating cardiovascular, endothelial or anglogenic disorders, such as atherosclerosis, wounds or cancer -
                                                                                                                                        Human angiogenesis-associated protein PRO182, SEQ ID NO:41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ashkenazi AJ, Baker KP, Ferrara N, Gerber H,

PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antigonist thereof. PRO nucleic acids, PRO proteins, antibodies against PRO proteins, PRO agonists and PRO antagonists may be used as therapeutic agents to treat cardiovascular, endothelial or angiogenic disorders, such as therefore or stroke. Sosteoporosis, myocardial infarction, hypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, psoriasis, endometriosis, ulcers, wounds, cancer, Alzheimer's disease, Huntington's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, to analyse genetic disorders, and in gene therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the development and screening of potential invaries. The present sequence represents a PRO protein of the invaries.
                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Relaxin-like factor - useful as replacement for relaxin in treatment of, e.g. cardiovascular or neuro:degenerative disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Forms disulphide bond with A chain Cysll" 22

```
The sequences given in AAW07862-63 represent the A and B chains of relaxin-like factor (RLF). RLF displaces bound relaxin tracer from the receptor to which it is bound. The RLF can be used to treat relaxin treatable conditions, esp. cardiovascular disease, neurocorrection treatable conditions as a proposition of degenerative or neurological disease, sinus bradycardia, depression, collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled or large in binding assays, and for relaxin receptor mapping. RLF collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled collagen (e.g. scleroderma) or fibronectin and insulin.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A. Title: Cloning of a CDNA for a novel insulin-like peptide of the testicular Leydig
A. Title: Cloning of a CDNA for a novel insulin-like peptide of the testicular Leydig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lieydig insulin-like protein precursor - pig
NiAlternate names: Ley I-L
C;Species: Sus scrofa domestica (domestic pig)
C;Species: 303-May-1994 #sequence_revision 03-May-1994 #text_change 05-Nov-1999
C;Accession: A53024; A49687
R;Burkhardt, E.; Adham, I.M.; Brosig, B.; Gastmann, A.; Mattel, M.G.; Engel, W. Genomics 20, 13-19, 1994
A;Atile: Structural organization of the porcine and human genes coding for a Leydig of A;Reforence number: A53024; MUID:94292772
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              F.1-24/Domain: signal sequence #status predicted <SIG>F:25-56/Domain: Leydig insulin-like protein chain B #status predicted <BCH>F:55-105/Domain: connecting C peptide #status predicted <CPEP>F:105/Domain: Leydig insulin-like protein chain A #status predicted <ACH>F:106-131/Domain: Leydig insulin-like protein chain A #status predicted <ACH>F:106-131/Domain: Leydig insulin-like protein chain A #status predicted <ACH>F:106-131/Domain S #status P #st

-!- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; are produced by alternative splicing.
-!- TISSUE SPECIFICITY: Expressed in the ovary during pregnancy. Also expressed in placenta, decidua and prostate.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
J. Mol. Biol. 221:15-21(1991).

-!- FUNCTION: RELAXIN IS AN OVARIAN HORMONE THAT ACTS WITH ESTROGEN PRODUCE DILATATION OF THE BIRTH CANAL IN MANY MAMMALS. MAY BE INVOLVED IN REMODELING OF CONNECTIVE TISSUES DURING PRECNANCY, PROMOTING GROWTH OF PUBIC LIGAMENTS AND RIPENING OF THE CERVIX.
-!- SUBUNIT: HETERODIMER OF A B CHAIN AND AN A CHAIN LINKED BY TWO DISULFIDE BONDS.
